LONG-TERM GOALS

Our long-term goal is to develop a 4-dimensional variational data assimilation system using COAMPS (Coupled Ocean/Atmosphere Mesoscale Prediction System), which could be used for many applications in mesoscale numerical weather prediction. The system can be used to assess the impact of remote-sensing observations on mesoscale and storm-scale prediction. The benefit of using 4D-Var than 3D-Var can also be tested. If computing power is increased, the system can potentially be used operationally at ONR.

OBJECTIVES

This ONR-related research focuses on three primary objectives:

1. Develop the COAMPS 4D-Var system - an effective, well-documented, and user friendly adjoint modeling system using COAMPS,
2. Applying the new system (once the COAMPS 4D-Var system is developed) to storm initialization using TPC (Tropical Prediction Center) observed parameters, and
3. Assimilate brightness temperature observations from Special Sensor Microwave Imager (SSM/I) obtained from a microwave radiometer system flown on DMSP satellites for hurricane initialization.

APPROACH

Technical approaches involve:

1. Four-dimensional variational data assimilation (4D-Var) with the COAMPS mesoscale model.
2. Adjoint sensitivity study.

The 4D-Var experiments assess the impact of various types of data, and the adjoint sensitivity calculations provide additional insights into the key components for model prediction.

Report Documentation Page				Form Approved OMB No. 0704-0188	
Public reporting burden for the collection of information is estimated to average 1 hour per response, including the time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information. Send comments regarding this burden estimate or any other aspect of this collection of information, including suggestions for reducing this burden, to Washington Headquarters Services, Directorate for Information Operations and Reports, 1215 Jefferson Davis Highway, Suite 1204, Arlington VA 22202-4302. Respondents should be aware that notwithstanding any other provision of law, no person shall be subject to a penalty for failing to comply with a collection of information if it does not display a currently valid OMB control number.

1. Drs. X. Zou and Q. Zhao: COAMPS 4D-Var system development, data assimilation, adjoint sensitivity study, and analysis of numerical results.
2. Graduate student Mr. Amerault: Development of a radiative transfer model for SSM/I brightness temperature, its tangent linear and adjoint models, adjoint sensitivity study, and analysis of numerical results.

WORK COMPLETED

The parallel scalable version of the Naval Research Laboratory's (NRL) Coupled Ocean/ Atmosphere Mesoscale Prediction System (COAMPS) has been thoroughly analyzed. An overall understanding of the COAMPS model system, especially the mechanism of communications among MPI sub-domains, has been achieved. A web page that includes hyper-links to the source code and called subroutines for each and every program /subroutine has been developed as an efficient reference. A tree structure of the model system has also been created. The tangent linear model is near completion.

The tangent linear and adjoint operators of a fast radiative transfer model, which are required for the direct assimilation of SSM/I microwave brightness temperatures, have been developed.

Evaluation of a storm initialization scheme using TPC observed parameters with SSM/I brightness temperatures.

RESULTS

No results to report at this stage. All the work was devoted to developing source codes.

IMPACT/APPLICATIONS

The COAMPS 4D-Var system is expected to improve mesoscale prediction using COAMPS and observations.

The study on the 4D-Var assimilation of the SSM/I brightness temperature gives a valuable contribution to hurricane track and intensity forecast.

TRANSITIONS

Upon finalizing the testing, the codes for the COAMPS 4D-Var system will be in the public domain.

RELATED PROJECTS

"Impact of radar, satellite and targeted *in situ* data on the hurricane forecasts near landfall", funded by NSF-USWRP under the project number ATM-9908939.

"Assimilation of Multi-Sensor Synoptic and Mesoscale Datasets: An Approach Based on Statistic, Dynamic, Physical and Synoptic Considerations", funded by ONR under the project number N00014-99-1-0022.

SUMMARY

A better understanding of the benefit of 4D-Var for mesoscale data assimilation could be tested. A step forward can be made towards improving the techniques for hurricane initialization. The ONR-sponsored work has helped strengthen our Data Assimilation Group, which is a trademark of our Department.
